1. INTRODUCTION

iREVEAL framework is a toolkit for generating reduced order models (ROMs) from high-fidelity model simulations. It has been developed under Carbon Capture Simulation Initiative for response surface generation of Computational Fluid Dynamics (CFD) models such as Multiphase Flow with Interphase Exchanges (MFIx), Barracuda, Fluent or any other high-fidelity models. Moreover, it is a generic framework and can be customized for use in other domains easily as well. The generated reduced order model is in a form that can be used by commercial process system engineering software Aspen Customer Modeler and Aspen Plus as a unit operation model.

2. PREREQUISITES

2.1. Hardware

N/A

2.2. Software

iREVEAL is a command line based software package with options to sample input space and build ROM. It has been tested on 32 bit and 64 bit windows platform and Ubuntu 64 bit Linux platform.

2.2.1 Required third party software packages

iREVEAL requires Java Runtime Environment to run the executable. For developers who are interested in further development, Java Development Kit (JDK) is required to compile the Java source code. iREVEAL's C++ source code can be compiled by Microsoft Visual Studio on Windows and g++ on Linux.

Note: Users are expected to run their own CFD or other high-fidelity model simulations

2.2.2 Software packages for integrating ROM with process system engineering package

To integrate an iREVEAL generated reduced order model in Aspen Plus for process simulation, the user needs the following software:

1. Aspen Plus version 9 or higher
2. Aspen ACM version 9 or higher

3. BASIC INSTALLATION

3.1. Third Party Software Installation

3.1.1 Java installation

To use iREVEAL, you need to have java runtime environment (JRE) installed on the system. To check if java is installed, open command line window and on prompt check for java version by type a command "java -version". You should get appropriate response listing java version. For example,

```
java version 1.7.x.x <build 1.6.x.x>
Java(TM) SE Runtime Environment
```

If JRE is not already installed, please install appropriate 32bit or 64 bit JRE

(download link- <http://www.oracle.com/technetwork/java/javase/downloads/index.html>)

For a developer who wants to modify the Java source code, JDK needs to be installed. Usually JDK contains the JRE.

3.1.2 Aspen Installation

Follow AspenTech's installation guide to install ACM and Aspen Plus version 9 or higher.

3.2. Product Build (For Developers Only)

Most users need not perform this step. User can download the iREVEAL installer directly from CCSI product page and skip section 3.2.

iREVEAL contains both Java and C++ source codes. The main executable is in C++, which calls the Java classes packed in a jar file.

To build iReveal jar file from Java source code, the user may follow the instructions below:

1. Checkout the iREVEAL code from our GitHub site, www.github.com/CCSI-toolset
2. Ensure you have JDK(Java Development Kit) installed (not just JRE)
3. Change directory to "Java" folder. Run script "make_ireveal_jar.bat" on Windows or "make_ireveal_jar.sh" on Linux. It will create a jar file name "iReveal.jar" in the "Java" directory.

To build C++ executable file "iReveal.exe" on Windows, open "iReveal.sln" file in Visual Studio and run "Build" command. The executable file will be in the "Release" folder.

To build C++ executable file "iReveal" on Linux, change directory to "iReveal" and run command "make". The executable file "iReveal" will be created in the same directory.

After the "iReveal.jar" and the C++ executable file are created, the developer need to put the two files in the same directory and install it in an installation directory. The developer can choose to create an installer for end users. Make sure the two files are in the same directory after installed.

3.3. Product Installation

iREVEAL is a command line based product. The binary executables include only two files "iReveal.jar" in the "Java" folder and "iReveal.exe" (Windows) or "iReveal" (Linux) in the "Release" folder, which can be built as discussed in Section 2. To install the software, simply copy the two files and paste them to a directory on your Windows or Linux machine (They have to be in the same directory). You can use that directory to run the commands. If you want to run it in any directory, please add that directory to your PATH environmental variable.

For the Linux user, usually ".profile" in user's home directory needs to be edited to add the installation directory to the \$PATH environmental variable. Also make sure "export PATH=.: \$PATH" is included in the ".profile" file such that the executable "iReveal" can be run without adding "./" before the command.

The user does not need to change CLASSPATH environmental variable as long as the “iReveal.jar” file is in the same directory as the executable file.

4. INSTALLATION TEST

To test iREVEAL installation, open a DOS window and type “iReveal.exe -v”. The version number will be printed to the screen. On Linux, type “iReveal -v”.

5. INSTALLATION PROBLEMS

5.1. Known Issues/Fixes

For Linux, make sure the “.profile” file is revised as described in Section 3. You may need to issue a command “source .profile” to make sure the PATH is set correctly.

5.2. Reporting Installation issues

Contact ccsi-support@acceleratecarboncapture.org.
